In algebraic geometry, a branch of mathematics, a Hilbert scheme is a scheme that is the parameter space for the closed subschemes of some projective space (or a more general projective scheme), refining the Chow variety.The Hilbert scheme is a disjoint union of projective subschemes corresponding to Hilbert polynomials.The basic theory of Hilbert schemes was developed by Alexander ...

A Hilbert space is a vector space  $H$  with an inner product  $\langle f, g \rangle$  such that the norm defined by  $\|f\| = \sqrt{\langle f, f \rangle}$  turns  $H$  into a complete metric space. If the metric defined by the norm is not complete, then  $H$  is instead known as an inner product space. Examples of finite-dimensional Hilbert spaces include 1. The real numbers  $\mathbb{R}^n$  with  $\langle v, u \rangle$  the vector dot product of  $v$  and  $u$ .

Hilbert's efforts to connect mathematics and philosophy is an important part of the book. "Just before the war Bertrand Russell, with A. N. Whitehead, had published his Principia Mathematica. Hilbert was convinced that the combination of mathematics, philosophy and logic represented by Russel should play a greater role in science." (144)
