This research has served as a precursor for the single-stage dimethyl ether (DME) synthesis, selective synthesis of propylene from syngas, and the synthesis of targeted hydrocarbons via DME route. More recent research efforts in this area involves methanol and derivatives from biological feedstocks as well as smaller-scale methanol synthesis with high energy efficiency.

Abstract. The commercial reactor type proposed for the liquid phase methanol synthesis (LPMeOH™) process is a liquid entrained reactor (LER), mainly due to its higher methanol productivity and better capability of alleviating the chemical equilibrium limitation than a mechanically agitated slurry reactor (MASR).
