An ultrasonic motor is a type of electric motor powered by the ultrasonic vibration of a component, the stator, placed against another component, the rotor or slider depending on the scheme of operation.

Ultrasonic motors differ from piezoelectric actuators in several ways, though both typically use some form of piezoelectric material, most often lead zirconate titanate and occasionally lithium niobate or other

Piezoelectric Ultrasonic Motor Technology Working and Applications. Ultrasonic motors were invented in 1965 by V.V Lavrinko. In general we are aware of the fact that the motive force is given by the electromagnetic field in the conventional motors. But, here to provide a motive force, these motors utilize the piezoelectric effect in the ultrasonic frequency range, which is from 20 kHz to 10 MHz and is

Piezoelectric Ultrasonic Motor Technology and Applications

An ultrasonic motor is a piezoelectric device which produces rotary or linear motion from ultrasonic vibrations via friction. Ultrasonic motors produce a much larger torque/force than conventional electromagnetic motors. Several basic principles are introduced for rotary and linear motors.

Ultrasonic sensors are used around the world, indoors and outdoors in the harshest conditions, for a variety of applications. Our ultrasonic sensors, made with piezoelectric crystals, use high frequency sound waves to resonate a desired frequency and convert electric energy into acoustic energy, and vice versa.

Ultrasonic motors also offer arbitrarily large rotation or sliding distances, while piezoelectric actuators are limited by the static strain that may be induced in the piezoelectric element. One common application of ultrasonic motors is in camera lenses where they are used to move lens elements as part of the auto-focus system.

Abstract. This study applied appropriate assumptions to simplify a surface acoustic wave (SAW) motor model, as well as the elastic friction layer concept to analyze the two-dimensional contact problem. The effect of inertial force was factored into the equation of motion for the friction layer; the relationship between external force and the displacement of the friction layer surface was determined via Fourier transform; and the displacement field under different loads was analyzed using ...
